

Computer Information Systems Business Application Development Specification/Design Document

Part 1: Objective

What do we hope to accomplish with this application

Part 2: Major Components

List the different part/modules/piece of the application that is being designed

Part 3: Design

This is where we put the design components broken down by the different modules. This section should be broken down into four parts per component. The first three parts should have spots for the user/client to sign off with an approval of the design.

A. Visual components

This is where you would put screen shots from a proto-type application

B. Printed output

This is where you would put sample reports

C. Basic overview of how the application will work

This is where you would put basic information about the module. This should be written in terms that a non-programmer/designer can understand. This is what the customer would read to make sure that everything is what they are expecting.

D. Detailed design concepts

This is where you would put detailed design information including pseudo-code and flowcharts.
